

# Download 2.5 Degrees To Radians

The radian (SI symbol rad) is the SI unit for measuring angles, and is the standard unit of angular measure used in many areas of mathematics. The length of an arc of a unit circle is numerically equal to the measurement in radians of the angle that it subtends; one radian is just under 57.3 degrees (expansion at OEIS: A072097). Radians are angular measurements based on pi and degrees, it is the unit of speed of revolution. ( $\pi=180^\circ$ ) The radian per second is also the unit of angular frequency. Number-theoretic and representation functions¶ `math.ceil(x)` ¶ Return the ceiling of x, the smallest integer greater than or equal to x. If x is not a float, delegates to `x.__ceil__()`, which should return an Integral value. The Fresnel equations and Snell's law are used to calculate the reflection and refraction that occurs at an interface of two materials when light falls on it at a given angle.
